#### 1. Crea una red bridge redbd

Creamos la red brigde por defecto

```
docker network create -d bridge redbd

docker network inspect redbd
```

```
756c0e0f1eb5 none
                         null
daw@daw-docker:~$ docker network create -d bridge redbd
0c9baf4ab38530fb0ba75b907bed6e6ade4627ab8556270c75eea25647342a27
daw@daw-docker:~$ docker network inspect redbd
[
    {
        "Name": "redbd",
        "Id": "Oc9baf4ab38530fb0ba75b907bed6e6ade4627ab8556270c75eea25647342a27",
        "Created": "2023-02-01T11:01:58.780492342+01:00",
        "Scope": "local",
        "Driver": "bridge"
        "EnableIPv6": false,
        "IPAM": {
            "Driver": "default",
            "Options": {},
            "Config": [
                    "Subnet": "172.21.0.0/16",
                    "Gateway": "172.21.0.1"
            ]
        "Internal": false,
        "Attachable": false,
        "Ingress": false,
        "Ingress
"ConfigFrom": {
            "Network":
        "ConfigOnly": false,
        "Containers": {},
        "Options": {},
        "Labels": {}
daw@daw-docker:~$
```

2. Crea un contenedor con una imagen de mariaDB que estará en la red redbd . Este contenedor se ejecutará en segundo plano, y será accesible a través del puerto 3306. (Es necesario definir la contraseña del usuario root y un volumen de datos persistente)

Creamos el volumen de datos

```
lotal rectaimed space: 828.4MB

daw@daw-docker:~$ docker volume ls

DRIVER VOLUME NAME

daw@daw-docker:~$ docker volume create volumenmariadb

volumenmariadb

daw@daw-docker:~$
```

Creamos un contenedor de mariaDB con las especificaciones marcadas:

```
docker run -d --name mymaria --env MARIADB_ROOT_PASSWORD=laboral1 -v
volumenmariadb:/var/run/mysqld --network redbd -p 3306:3306 mariadb:10.5

volumenmariadb:/var/run/mysqld --network redbd -p 3306:3306 mariadb:10.5

volumenmariadb:/var/run/mysqld --network redbd -p 3306:3306 mariadb:10.5

offolo4df025fbb539457dereb9fc10b5fc9816bd61b3891d62affb8d129e3ea3

daw@daw-docker:-$ docker ps -a

contrainer in image command contrainer in image contrain
```

### 3. Crear un contenedor con Adminer que se pueda conectar al contenedor de la BD

Creamos el contenedos de admin con redbrige para que se pueda conectar a la BBDD despues de haber leido la Documentación de Adminer en Dockerhub

```
docker run --link mymaria:db -p 8080:8080 --network redbd adminer
                                                           s weeks ago
daw@daw-docker:~$ docker run --link mymaria:db -p 8080:8080 --network redbd adminer
[Fri Feb 3 08:01:18 2023] PHP 7.4.33 Development Server (http://[::]:8080) started

```

### 4. Comprobar que el contenedor Adminer puede conectar con el

# contenedor mysql abriendo un navegador web y accediendo a la URL: http://localhost:8080

Como vemos, desde el puerto 8080 podemos acceder a la aplicación Adminer 6° Login - db - Adminer O localhost:8080/?server=db Idioma: Español ~ Adminer 4.8.1 Login Sesión finalizada con éxito. Thanks for using Adminer, consider donating. Motor de base de datos MySQL Servidor db Usuario root Contraseña Base de datos Login Guardar contraseña

# Entregar los siguientes pantallazos y los comandos empleados para resolver cada apartado:

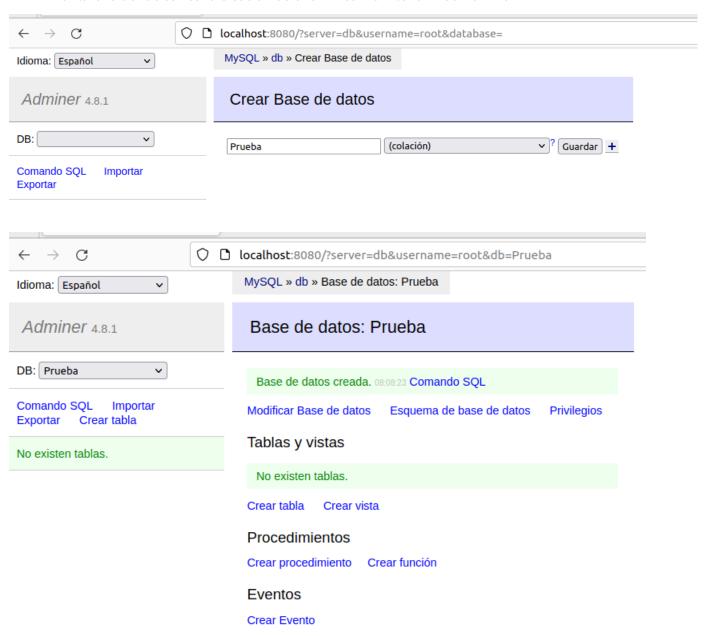

• Pantallazos donde se vean los contenedores creados y en ejecución

• Pantallazo donde se vea el acceso a la BD a través de la interfaz web de Adminer

Pantallazo donde se vea la creación de una BD con la interfaz web Adminer

 Pantallazo donde se entre a la consola del servidor web en modo texto y se compruebe que se ha creado la BD

Entramos a mariadb por linea de comandos

```
docker exec -it mymaria mariadb --user root -plaboral1
```

Dentro ejecutamos el comando Show databases para ver todas las BBDD de MariaDB, vemos que estara la que hemos creado con Adminer

```
SHOW databases;

ERRUR 1049 (42000): Unknown database 'laborall'
daw@daw-docker:~$ docker exec -it mymaria mariadb --user root -plaboral1
Welcome to the MariaDB monitor. Commands end with ; or \g.
